

# Security Policies

ECS 153 Spring Quarter 2021

Module 8

# Security Policy

- Policy partitions system states into:
  - Authorized (secure)
    - These are states the system can enter
  - Unauthorized (nonsecure)
    - If the system enters any of these states, it's a security violation
- Secure system
  - Starts in authorized state
  - Never enters unauthorized state

# Confidentiality

- $X$  set of entities,  $I$  information
- $I$  has the *confidentiality* property with respect to  $X$  if no  $x \in X$  can obtain information from  $I$
- $I$  can be disclosed to others
- Example:
  - $X$  set of students
  - $I$  final exam answer key
  - $I$  is confidential with respect to  $X$  if students cannot obtain final exam answer key

# Integrity

- $X$  set of entities,  $I$  information
- $I$  has the *integrity* property with respect to  $X$  if all  $x \in X$  trust information in  $I$
- Types of integrity:
  - Trust  $I$ , its conveyance and protection (data integrity)
  - $I$  information about origin of something or an identity (origin integrity, authentication)
  - $I$  resource: means resource functions as it should (assurance)

# Availability

- $X$  set of entities,  $I$  resource
- $I$  has the *availability* property with respect to  $X$  if all  $x \in X$  can access  $I$
- Types of availability:
  - Traditional:  $x$  gets access or not
  - Quality of service: promised a level of access (for example, a specific level of bandwidth);  $x$  meets it or not, even though some access is achieved

# Policy Models

- Abstract description of a policy or class of policies
- Focus on points of interest in policies
  - Security levels in multilevel security models
  - Separation of duty in Clark-Wilson model
  - Conflict of interest in Chinese Wall model

# Mechanisms

- Entity or procedure that enforces some part of the security policy
  - Access controls (like bits to prevent someone from reading a homework file)
  - Disallowing people from bringing CDs and floppy disks into a computer facility to control what is placed on systems

# Question

- Policy disallows cheating
  - Includes copying homework, with or without permission
- CS class has students do homework on computer
- Anne forgets to read-protect her homework file
- Bill copies it
- Who breached security?
  - Anne, Bill, or both?

# Answer Part 1

- Bill clearly breached security
  - Policy forbids copying homework assignment
  - Bill did it
  - System entered unauthorized state (Bill having a copy of Anne's assignment)
- If not explicit in computer security policy, certainly implicit
  - Not credible that a unit of the university allows something that the university as a whole forbids, unless the unit explicitly says so

# Answer Part 2

- Anne didn't protect her homework
  - Not required by security policy
- She didn't breach security
- If policy said students had to read-protect homework files, then Anne did breach security
  - She didn't do this

# Types of Security Policies

- Military (governmental) security policy
  - Policy primarily protecting confidentiality
- Commercial security policy
  - Policy primarily protecting integrity
- Confidentiality policy
  - Policy protecting only confidentiality
- Integrity policy
  - Policy protecting only integrity

# Integrity and Transactions

- Begin in consistent state
  - “Consistent” defined by specification
- Perform series of actions (*transaction*)
  - Actions cannot be interrupted
  - If actions complete, system in consistent state
  - If actions do not complete, system reverts to a consistent state

# Trust

## Administrator installs patch

1. Trusts patch came from vendor, not tampered with in transit
2. Trusts vendor tested patch thoroughly
3. Trusts vendor's test environment corresponds to local environment
4. Trusts patch is installed correctly

# Trust in Formal Verification

- Gives formal mathematical proof that given input  $i$ , program  $P$  produces output  $o$  as specified
- Suppose a security-related program  $S$  formally verified to work with operating system  $O$
- What are the assumptions?

# Trust in Formal Methods

1. Proof has no errors
  - Bugs in automated theorem provers
2. Preconditions hold in environment in which  $S$  is to be used
3.  $S$  transformed into executable  $S'$  whose actions follow source code
  - Compiler bugs, linker/loader/library problems
4. Hardware executes  $S'$  as intended
  - Hardware bugs (Pentium £00£ bug, for example)

# Types of Access Control

- Discretionary Access Control (DAC, IBAC)
  - Individual user sets access control mechanism to allow or deny access to an object
- Mandatory Access Control (MAC)
  - System mechanism controls access to object, and individual cannot alter that access
- Originator Controlled Access Control (ORCON, ORGCON)
  - Originator (creator) of information controls who can access information

# Policy Languages

- Express security policies in a precise way
- High-level languages
  - Policy constraints expressed abstractly
- Low-level languages
  - Policy constraints expressed in terms of program options, input, or specific characteristics of entities on system

# High-Level Policy Languages

- Constraints expressed independent of enforcement mechanism
- Constraints restrict entities, actions
- Constraints expressed unambiguously
  - Requires a precise language, usually a mathematical, logical, or programming-like language

# Example: Ponder

- Security and management policy specification language
- Handles many types of policies
  - Authorization policies
  - Delegation policies
  - Information filtering policies
  - Obligation policies
  - Refrain policies

# Entities

- Organized into hierarchical domains
- Network administrators
  - *Domain* is /NetAdmins
  - Subdomain for net admin trainees is
  - /NetAdmins/Trainees
- Routers in LAN
  - Domain is /localnet
  - Subdomain that is a testbed for routers is
  - /localnet/testbed/routers

# Authorization Policies

- Allowed actions: netadmins can enable, disable, reconfigure, view configuration of routers

```
inst auth+ switchAdmin {  
    subject /NetAdmins;  
    target /localnetwork/routers;  
    action enable(), disable(), reconfig(), dumpconfig();  
}
```

# Authorization Policies

- Disallowed actions: trainees cannot test performance between 8AM and 5PM

```
inst auth- testOps {  
    subject /NetEngineers/trainees;  
    target   /localnetwork/routers;  
    action   testperformance();  
    when     Time.between("0800", "1700");  
}
```

# Delegation Policies

- Delegated rights: net admins delegate to net engineers the right to enable, disable, reconfigure routers on the router testbed

```
inst deleg+ (switchAdmin) delegSwitchAdmin {  
    grantee    /NetEngineers;  
    target    /localnetwork/testNetwork/routers;  
    action    enable(), disable(), reconfig();  
    valid     Time.duration(8);  
}
```

# Information Filtering Policies

- Control information flow: net admins can dump everything from routers between 8PM and 5AM, and config info anytime

```
inst auth+ switchOpsFilter {  
    subject    /NetAdmins;  
    target     /localnetwork/routers;  
    action     dumpconfig(what)  
                { in partial = "config"; }  
    if (Time.between("2000", "0500")){  
        in partial = "all"; }  
}
```

# Refrain Policies

- Like authorization denial policies, but enforced by the *subjects*: net engineers cannot send test results to net developers while testing in progress

```
inst refrain testSwitchOps {  
    subject s=/NetEngineers;  
    target /NetDevelopers;  
    action sendTestResults();  
    when s.teststate="in progress"  
}
```

# Obligation Policies

- Must take actions when events occur: on 3<sup>rd</sup> login failure, net security admins will disable account and log event

```
inst oblig loginFailure {  
    on          loginfail(userid, 3);  
    subject    s=/NetAdmins/SecAdmins;  
    target     t=/NetAdmins/users ^ (userid);  
    do         t.disable() -> s.log(userid);  
}
```

# Example

- Policy: separation of duty requires 2 different members of Accounting approve check

```
inst auth+ separationOfDuty {  
    subject    s=/Accountants;  
    target     t=checks;  
    action     approve(), issue();  
    when       s.id <> t.issuerid;  
}
```

# Low-Level Policy Languages

- Set of inputs or arguments to commands
  - Check or set constraints on system
- Low level of abstraction
  - Need details of system, commands

# Example: tripwire

- File scanner that reports changes to file system and file attributes
  - *tw.config* describes what may change
    - `/usr/mab/tripwire +gimnpsu012345678-a`
      - Check everything but time of last access (“-a”)
  - Database holds previous values of attributes

# Example Database Record

```
/usr/mab/tripwire/README 0 ..../. 100600 45763 1 917 10 33242  
.gtPvf .gtPvY .gtPvY 0 .ZD4cc0Wr8i21ZKaI..LUOr3  
.0fwo5:hf4e4.8TAqd0V4ubv ?..... ...9b3 1M4GX01xbGIX0oVuGo1h15z3  
?:Y9jfa04rdzM1q:egt1APgHk ?.Eb9yo.2zkEh1XKovX1:d0wF0kfAvC  
?1M4GX01xbGIX2947jdyrior38h15z3 0
```

- file name, version, bitmask for attributes, mode, inode number, number of links, UID, GID, size, times of creation, last modification, last access, cryptographic checksums

# Comments

- System administrators not expected to edit database to set attributes properly
- Checking for changes with tripwire is easy
  - Just run once to create the database, run again to check
- Checking for conformance to policy is harder
  - Need to either edit database file, or (better) set system up to conform to policy, then run tripwire to construct database

# Example English Policy

- Computer security policy for academic institution
  - Institution has multiple campuses, administered from central office
  - Each campus has its own administration, and unique aspects and needs
- Deals with electronic communications
  - Policy
  - User Advisories
  - Implementation at University of California Davis

# Background

- University of California
  - 10 campuses (including UC Davis), each run by a Chancellor
  - UC Office of the President (UCOP) runs system, and is run by President of University of California
- UCOP issues policies that apply to all campuses
- Campuses implement the policy in a manner consistent with directions from UCOP

# Electronic Communications Policy

- Begins with purpose, to whom policy applies
  - Includes email, video, voice, other means
  - Not to printed copies of communications
  - Not to Dept. of Energy labs that UC manages, or to Dept. of Energy employees
- Gives general implementation guidelines

# Use of Electronic Communications

- University does *not* want to deal with contents of these!
  - But all communications relating to University administration are public records
  - Others may be too
- Allowable users
  - Faculty, staff, students, others associated with UC
  - Others authorized by the Chancellors or UCOP
  - Others participating in programs UC sponsors

# Allowable Uses

- University business
  - Classes, research, *etc.*
- Incidental personal use OK
  - But can't interfere with other uses
- Anonymous communications OK
  - But can't use a false identity

# Non-Allowable Uses

- Endorsements not OK
- Running personal businesses not OK
- Illegal activities not OK
  - Must respect intellectual property laws, US DMCA
- Violating University of campus policies or rules not OK
- Users can't put "excessive strain" on resources
  - No spamming, DoD or DDoS attacks

# Privacy, Confidentiality

- General rule: respected the same way as is for paper
- Cannot read or disclose without permission of holder, except in specific circumstances
- To do so requires written permission of:
  - A designated Vice Chancellor (campus)
  - A Senior Vice President, Business and Finance (UCOP)

# Privacy, Confidentiality

- Written permission not required for:
  - Subpoena or search warrant
  - Emergency
    - But must obtain approval as soon as possible afterwards
  - In all these cases, must notify those affected by the disclosure that the disclosure occurred, and why

# Limits of Privacy

- Electronic communications that are public records will not be confidential
- Electronic communications may be on backups
- Electronic communications may be seen during routine system monitoring, etc.
  - Admins instructed to respect privacy, but *will* report “improper governmental activity”

# Security Services, Practices

- Routine monitoring
- Need for authentication
- Need for authorization
- Need for recovery mechanisms
- Need for audit mechanisms
- Other mechanisms to enforce University policy

# User Advisories

- These are less formal, give guidelines for the use of electronic communications
  - Show courtesy and consideration as in non-electronic communications
  - Laws about privacy in electronic communications are not as mature as laws about privacy in other areas
  - University provides neither encryption nor authentication
    - Easy to falsify sender

# UC Davis Implementation

- Acceptable Use Policy
  - Incorporates the UCD Principles of Community
  - Requires respect of rights of others when using electronic communications
  - Use encouraged for education, university business, university-related activities

# UC Davis Implementation

- UC Davis specific details
  - Only Chancellor-approved charitable activities may use these resources
  - Cannot be used to create hostile environment
    - This includes violating obscenity laws
  - Incidental personal use OK under conditions given in Electronic Communications Policy

# UC Davis Implementation

- Unacceptable conduct
  - Not protecting passwords for University resources
  - Not respecting copyrights, licenses
  - Violating integrity of these resources
  - Creating malicious logic (worms, viruses, *etc.*)
    - Allowed if done as part of an academic research or instruction program supervised by academic personnel; and
    - It does not compromise the University's electric communication resource

# UC Davis Implementation

- Allowed users
  - UCD students, staff, faculty
  - Other UCD academic appointees and affiliated people
    - Such as postdocs and visiting scholars
- People leaving
  - Forwarding email allowed
  - Recipient must agree to return to the University any email about University business

# Exceptions Allowing Disclosure

- Required by law;
- Reliable evidence of violation of law, University policies;
- Failure to do so may result in:
  - Significant harm
  - Loss of significant evidence of violations;
  - Significant liability to UC or its community;
- Not doing so hampers University meeting administrative, teaching obligations
