

Basic Security Theorem

- Define action, secure formally
 - Using a bit of foreshadowing for “secure”
- Restate properties formally
 - Simple security condition
 - *-property
 - Discretionary security property
- State conditions for properties to hold
- State Basic Security Theorem

April 27, 2004

ECS 235

Slide #1

Action

- A request and decision that causes the system to move from one state to another
 - Final state may be the same as initial state
- $(r, d, v, v') \in R \times D \times V \times V$ is an *action* of $\Sigma(R, D, W, z_0)$ iff there is an $(x, y, z) \in \Sigma(R, D, W, z_0)$ and a $t \in N$ such that $(r, d, v, v') = (x_t, y_t, z_t, z_{t-1})$
 - Request r made when system in state v ; decision d moves system into (possibly the same) state v'
 - Correspondence with (x_t, y_t, z_t, z_{t-1}) makes states, requests, part of a sequence

April 27, 2004

ECS 235

Slide #2

Simple Security Condition

- $(s, o, p) \in S \times O \times P$ satisfies the simple security condition relative to f (written *ssc rel f*) iff one of the following holds:
 1. $p = \underline{e}$ or $p = \underline{a}$
 2. $p = \underline{r}$ or $p = \underline{w}$ and $f_c(s) \text{ dom } f_o(o)$
- Holds vacuously if rights do not involve reading
- If all elements of b satisfy *ssc rel f*, then state satisfies simple security condition
- If all states satisfy simple security condition, system satisfies simple security condition

April 27, 2004

ECS 235

Slide #3

Necessary and Sufficient

- $\Sigma(R, D, W, z_0)$ satisfies the simple security condition for any secure state z_0 iff for every action $(r, d, (b, m, f, h), (b', m', f', h'))$, W satisfies
 - Every $(s, o, p) \in b - b'$ satisfies *ssc rel f*
 - Every $(s, o, p) \in b'$ that does not satisfy *ssc rel f* is not in b
- Note: “secure” means z_0 satisfies *ssc rel f*
- First says every (s, o, p) added satisfies *ssc rel f*; second says any (s, o, p) in b' that does not satisfy *ssc rel f* is deleted

April 27, 2004

ECS 235

Slide #4

*-Property

- $b(s: p_1, \dots, p_n)$ set of all objects that s has p_1, \dots, p_n access to
- State (b, m, f, h) satisfies the *-property iff for each $s \in S$ the following hold:
 1. $b(s: \underline{a}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{a}) [f_o(o) \text{ dom } f_c(s)]]$
 2. $b(s: \underline{w}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{w}) [f_o(o) = f_c(s)]]$
 3. $b(s: \underline{r}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{r}) [f_c(s) \text{ dom } f_o(o)]]$
- Idea: for writing, object dominates subject; for reading, subject dominates object

April 27, 2004

ECS 235

Slide #5

*-Property

- If all states satisfy simple security condition, system satisfies simple security condition
- If a subset S' of subjects satisfy *-property, then *-property satisfied relative to $S' \subseteq S$
- Note: tempting to conclude that *-property includes simple security condition, but this is false
 - See condition placed on \underline{w} right for each

April 27, 2004

ECS 235

Slide #6

Necessary and Sufficient

- $\Sigma(R, D, W, z_0)$ satisfies the *-property relative to $S' \subseteq S$ for any secure state z_0 iff for every action $(r, d, (b, m, f, h), (b', m', f', h'))$, W satisfies the following for every $s \in S'$
 - Every $(s, o, p) \in b - b'$ satisfies the *-property relative to S'
 - Every $(s, o, p) \in b'$ that does not satisfy the *-property relative to S' is not in b
- Note: “secure” means z_0 satisfies *-property relative to S'
- First says every (s, o, p) added satisfies the *-property relative to S' ; second says any (s, o, p) in b' that does not satisfy the *-property relative to S' is deleted

April 27, 2004

ECS 235

Slide #7

Discretionary Security Property

- State (b, m, f, h) satisfies the discretionary security property iff, for each $(s, o, p) \in b$, then $p \in m[s, o]$
- Idea: if s can read o , then it must have rights to do so in the access control matrix m
- This is the discretionary access control part of the model
 - The other two properties are the mandatory access control parts of the model

April 27, 2004

ECS 235

Slide #8

Necessary and Sufficient

- $\Sigma(R, D, W, z_0)$ satisfies the ds-property for any secure state z_0 iff, for every action $(r, d, (b, m, f, h), (b', m', f', h'))$, W satisfies:
 - Every $(s, o, p) \in b - b'$ satisfies the ds-property
 - Every $(s, o, p) \in b'$ that does not satisfy the ds-property is not in b
- Note: “secure” means z_0 satisfies ds-property
- First says every (s, o, p) added satisfies the ds-property; second says any (s, o, p) in b' that does not satisfy the *-property is deleted

April 27, 2004

ECS 235

Slide #9

Secure

- A system is secure iff it satisfies:
 - Simple security condition
 - *-property
 - Discretionary security property
- A state meeting these three properties is also said to be secure

April 27, 2004

ECS 235

Slide #10

Basic Security Theorem

- $\Sigma(R, D, W, z_0)$ is a secure system if z_0 is a secure state and W satisfies the conditions for the preceding three theorems
 - The theorems are on the slides titled “Necessary and Sufficient”

April 27, 2004

ECS 235

Slide #11

Rule

- $\rho: R \times V \rightarrow D \times V$
- Takes a state and a request, returns a decision and a (possibly new) state
- Rule ρ *ssc-preserving* if for all $(r, v) \in R \times V$ and v satisfying *ssc rel f*, $\rho(r, v) = (d, v')$ means that v' satisfies *ssc rel f'*.
 - Similar definitions for *-property, ds-property
 - If rule meets all 3 conditions, it is *security-preserving*

April 27, 2004

ECS 235

Slide #12

Unambiguous Rule Selection

- Problem: multiple rules may apply to a request in a state
 - if two rules act on a read request in state $v \dots$
- Solution: define relation $W(\omega)$ for a set of rules $\omega = \{ \rho_1, \dots, \rho_m \}$ such that a state $(r, d, v, v') \in W(\omega)$ iff either
 - $d = \underline{i}$; or
 - for exactly one integer j , $\rho_j(r, v) = (d, v')$
- Either request is illegal, or only one rule applies

April 27, 2004

ECS 235

Slide #13

Rules Preserving SSC

- Let ω be set of *ssc*-preserving rules. Let state z_0 satisfy simple security condition. Then $\Sigma(R, D, W(\omega), z_0)$ satisfies simple security condition
 - Proof: by contradiction.
 - Choose $(x, y, z) \in \Sigma(R, D, W(\omega), z_0)$ as state not satisfying simple security condition; then choose $t \in N$ such that (x_t, y_t, z_t) is first appearance not meeting simple security condition
 - As $(x_t, y_t, z_t, z_{t-1}) \in W(\omega)$, there is unique rule $\rho \in \omega$ such that $\rho(x_t, z_{t-1}) = (y_t, z_t)$ and $y_t \neq \underline{i}$.
 - As ρ *ssc*-preserving, and z_{t-1} satisfies simple security condition, then z_t meets simple security condition, contradiction.

April 27, 2004

ECS 235

Slide #14

Adding States Preserving SSC

- Let $v = (b, m, f, h)$ satisfy simple security condition. Let $(s, o, p) \notin b$, $b' = b \cup \{ (s, o, p) \}$, and $v' = (b', m, f, h)$. Then v' satisfies simple security condition iff:
 1. Either $p = \underline{e}$ or $p = \underline{a}$; or
 2. Either $p = \underline{r}$ or $p = \underline{w}$, and $f_c(s) \text{ dom } f_o(o)$
 - Proof
 1. Immediate from definition of simple security condition and v' satisfying *ssc rel f*
 2. v' satisfies simple security condition means $f_c(s) \text{ dom } f_o(o)$, and for converse, $(s, o, p) \in b'$ satisfies *ssc rel f*, so v' satisfies simple security condition

April 27, 2004

ECS 235

Slide #15

Rules, States Preserving *-Property

- Let ω be set of *-property-preserving rules, state z_0 satisfies *-property. Then $\Sigma(R, D, W(\omega), z_0)$ satisfies *-property
- Let $v = (b, m, f, h)$ satisfy *-property. Let $(s, o, p) \notin b$, $b' = b \cup \{ (s, o, p) \}$, and $v' = (b', m, f, h)$. Then v' satisfies *-property iff one of the following holds:
 1. $p = \underline{e}$ or $p = \underline{a}$
 2. $p = \underline{r}$ or $p = \underline{w}$ and $f_c(s) \text{ dom } f_o(o)$

April 27, 2004

ECS 235

Slide #16

Rules, States Preserving ds-Property

- Let ω be set of ds-property-preserving rules, state z_0 satisfies ds-property. Then $\Sigma(R, D, W(\omega), z_0)$ satisfies ds-property
- Let $v = (b, m, f, h)$ satisfy ds-property. Let $(s, o, p) \notin b$, $b' = b \cup \{ (s, o, p) \}$, and $v' = (b', m, f, h)$. Then v' satisfies ds-property iff $p \in m[s, o]$.

April 27, 2004

ECS 235

Slide #17

Combining

- Let ρ be a rule and $\rho(r, v) = (d, v')$, where $v = (b, m, f, h)$ and $v' = (b', m', f', h')$. Then:
 1. If $b' \subseteq b$, $f' = f$, and v satisfies the simple security condition, then v' satisfies the simple security condition
 2. If $b' \subseteq b$, $f' = f$, and v satisfies the *-property, then v' satisfies the *-property
 3. If $b' \subseteq b$, $m[s, o] \subseteq m'[s, o]$ for all $s \in S$ and $o \in O$, and v satisfies the ds-property, then v' satisfies the ds-property

April 27, 2004

ECS 235

Slide #18

Proof

1. Suppose v satisfies simple security property.
 - a) $b' \subseteq b$ and $(s, o, \underline{r}) \in b'$ implies $(s, o, \underline{r}) \in b$
 - b) $b' \subseteq b$ and $(s, o, \underline{w}) \in b'$ implies $(s, o, \underline{w}) \in b$
 - c) So $f'_c(s) \text{ dom } f'_o(o)$
 - d) But $f' = f$
 - e) Hence $f'_c(s) \text{ dom } f'_o(o)$
 - f) So v' satisfies simple security condition
- 2, 3 proved similarly

April 27, 2004

ECS 235

Slide #19

Example Instantiation: Multics

- 11 rules affect rights:
 - set to request, release access
 - set to give, remove access to different subject
 - set to create, reclassify objects
 - set to remove objects
 - set to change subject security level
- Set of “trusted” subjects $S_T \subseteq S$
 - *-property not enforced; subjects trusted not to violate
- $\Delta(\rho)$ domain
 - determines if components of request are valid

April 27, 2004

ECS 235

Slide #20

get-read Rule

- Request $r = (get, s, o, \underline{r})$
 - s gets (requests) the right to read o
- Rule is $\rho_1(r, v)$:
 - if** $(r \neq \Delta(\rho_1))$ **then** $\rho_1(r, v) = (\underline{i}, v)$;
 - else if** $(f_s(s) \text{ dom } f_o(o) \text{ and } [s \in S_T \text{ or } f_c(s) \text{ dom } f_o(o)])$
 - and** $r \in m[s, o]$
 - then** $\rho_1(r, v) = (y, (b \cup \{ (s, o, \underline{r}) \}, m, f, h))$;
 - else** $\rho_1(r, v) = (\underline{n}, v)$;

April 27, 2004

ECS 235

Slide #21

Security of Rule

- The get-read rule preserves the simple security condition, the *-property, and the ds-property
 - Proof
 - Let v satisfy all conditions. Let $\rho_1(r, v) = (d, v')$. If $v' = v$ result is trivial. So let $v' = (b \cup \{ (s_2, o, \underline{r}) \}, m, f, h)$.

April 27, 2004

ECS 235

Slide #22

Proof

- Consider the simple security condition.
 - From the choice of v' , either $b' - b = \emptyset$ or $b' - b = \{ (s_2, o, \underline{r}) \}$
 - If $b' - b = \emptyset$, then $\{ (s_2, o, \underline{r}) \} \in b$, so $v = v'$, proving that v' satisfies the simple security condition.
 - If $b' - b = \{ (s_2, o, \underline{r}) \}$, because the *get-read* rule requires that $f_c(s) \text{ dom } f_o(o)$, an earlier result says that v' satisfies the simple security condition.

April 27, 2004

ECS 235

Slide #23

Proof

- Consider the *-property.
 - Either $s_2 \in S_T$ or $f_c(s) \text{ dom } f_o(o)$ from the definition of *get-read*
 - If $s_2 \in S_T$, then s_2 is trusted, so *-property holds by definition of trusted and S_T .
 - If $f_c(s) \text{ dom } f_o(o)$, an earlier result says that v' satisfies the simple security condition.

April 27, 2004

ECS 235

Slide #24

Proof

- Consider the discretionary security property.
 - Conditions in the *get-read* rule require $\underline{r} \in m[s, o]$ and either $b' - b = \emptyset$ or $b' - b = \{ (s_2, o, \underline{r}) \}$
 - If $b' - b = \emptyset$, then $\{ (s_2, o, \underline{r}) \} \in b$, so $v = v'$, proving that v' satisfies the simple security condition.
 - If $b' - b = \{ (s_2, o, \underline{r}) \}$, then $\{ (s_2, o, \underline{r}) \} \notin b$, an earlier result says that v' satisfies the ds-property.

April 27, 2004

ECS 235

Slide #25

give-read Rule

- Request $r = (s_1, \textit{give}, s_2, o, \underline{r})$
 - s_1 gives (request to give) s_2 the (discretionary) right to read o
 - Rule: can be done if giver can alter parent of object
 - If object or parent is root of hierarchy, special authorization required
- Useful definitions
 - $\textit{root}(o)$: root object of hierarchy h containing o
 - $\textit{parent}(o)$: parent of o in h (so $o \in h(\textit{parent}(o))$)
 - $\textit{canallow}(s, o, v)$: s specially authorized to grant access when object or parent of object is root of hierarchy
 - $m \wedge m[s, o] \leftarrow \underline{r}$: access control matrix m with \underline{r} added to $m[s, o]$

April 27, 2004

ECS 235

Slide #26

give-read Rule

- Rule is $\rho_6(r, v)$:
 - if** $(r \neq \Delta(\rho_6))$ **then** $\rho_6(r, v) = (\underline{i}, v)$;
 - else if** $([o \neq \text{root}(o)$ **and** $\text{parent}(o) \neq \text{root}(o)$ **and** $\text{parent}(o) \in b(s_1; \underline{w})]$ **or** $[\text{parent}(o) = \text{root}(o)$ **and** $\text{canallow}(s_1, o, v)$] **or** $[o = \text{root}(o)$ **and** $\text{canallow}(s_1, o, v)$])
 - then** $\rho_6(r, v) = (y, (b, m \wedge m[s_2, o] \leftarrow \underline{r}, f, h))$;
 - else** $\rho_1(r, v) = (\underline{n}, v)$;

April 27, 2004

ECS 235

Slide #27

Security of Rule

- The *give-read* rule preserves the simple security condition, the *-property, and the ds-property
 - Proof: Let v satisfy all conditions. Let $\rho_1(r, v) = (d, v')$. If $v' = v$, result is trivial. So let $v' = (b, m[s_2, o] \leftarrow \underline{r}, f, h)$. $b' = b, f' = f, m[x, y] = m'[x, y]$ for all $x \in S$ and $y \in O$ such that $x \neq s$ and $y \neq o$, and $m[s, o] \subseteq m'[s, o]$. So, by earlier result, v' satisfies the simple security condition, the *-property, and the ds-property.

April 27, 2004

ECS 235

Slide #28

Principle of Tranquility

- Raising object's security level
 - Information once available to some subjects is no longer available
 - Usually assume information has already been accessed, so this does nothing
- Lowering object's security level
 - The *declassification problem*
 - Essentially, a “write down” violating *-property
 - Solution: define set of trusted subjects that *sanitize* or remove sensitive information before security level lowered

April 27, 2004

ECS 235

Slide #29

Types of Tranquility

- Strong Tranquility
 - The clearances of subjects, and the classifications of objects, do not change during the lifetime of the system
- Weak Tranquility
 - The clearances of subjects, and the classifications of objects, do not change in a way that violates the simple security condition or the *-property during the lifetime of the system

April 27, 2004

ECS 235

Slide #30

Example

- DG/UX System
 - Only a trusted user (security administrator) can lower object's security level
 - In general, process MAC labels cannot change
 - If a user wants a new MAC label, needs to initiate new process
 - Cumbersome, so user can be designated as able to change process MAC label within a specified range

April 27, 2004

ECS 235

Slide #31

Controversy

- McLean:
 - “value of the BST is much overrated since there is a great deal more to security than it captures. Further, what is captured by the BST is so trivial that it is hard to imagine a realistic security model for which it does not hold.”
 - Basis: given assumptions known to be non-secure, BST can prove a non-secure system to be secure

April 27, 2004

ECS 235

Slide #32

†-Property

- State (b, m, f, h) satisfies the †-property iff for each $s \in S$ the following hold:
 1. $b(s: \underline{a}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{a}) [f_c(s) \text{ dom } f_o(o)]]$
 2. $b(s: \underline{w}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{w}) [f_o(o) = f_c(s)]]$
 3. $b(s: \underline{r}) \neq \emptyset \Rightarrow [\forall o \in b(s: \underline{r}) [f_c(s) \text{ dom } f_o(o)]]$
- Idea: for writing, subject dominates object; for reading, subject also dominates object
- Differs from *-property in that the mandatory condition for writing is reversed
 - For *-property, it's object dominates subject

April 27, 2004

ECS 235

Slide #33

Analogues

The following two theorems can be proved

- $\Sigma(R, D, W, z_0)$ satisfies the †-property relative to $S' \subseteq S$ for any secure state z_0 iff for every action $(r, d, (b, m, f, h), (b', m', f', h'))$, W satisfies the following for every $s \in S'$
 - Every $(s, o, p) \in b - b'$ satisfies the †-property relative to S'
 - Every $(s, o, p) \in b'$ that does not satisfy the †-property relative to S' is not in b
- $\Sigma(R, D, W, z_0)$ is a secure system if z_0 is a secure state and W satisfies the conditions for the simple security condition, the †-property, and the discretionary security property.

April 27, 2004

ECS 235

Slide #34

Problem

- This system is *clearly* non-secure!
 - Information flows from higher to lower because of the \dagger -property

April 27, 2004

ECS 235

Slide #35

Discussion

- Role of Basic Security Theorem is to demonstrate that rules preserve security
- Key question: what is security?
 - Bell-LaPadula defines it in terms of 3 properties (simple security condition, *-property, discretionary security property)
 - Theorems are assertions about these properties
 - Rules describe changes to a *particular* system instantiating the model
 - Showing system is secure requires proving rules preserve these 3 properties

April 27, 2004

ECS 235

Slide #36

Rules and Model

- Nature of rules is irrelevant to model
- Model treats “security” as axiomatic
- Policy defines “security”
 - This instantiates the model
 - Policy reflects the requirements of the systems
- McLean’s definition differs from Bell-LaPadula
 - ... and is not suitable for a confidentiality policy
- Analysts cannot prove “security” definition is appropriate through the model

April 27, 2004

ECS 235

Slide #37

System Z

- System supporting weak tranquility
- On *any* request, system downgrades *all* subjects and objects to lowest level and adds the requested access permission
 - Let initial state satisfy all 3 properties
 - Successive states also satisfy all 3 properties
- Clearly not secure
 - On first request, everyone can read everything

April 27, 2004

ECS 235

Slide #38

Reformulation of Secure Action

- Given state that satisfies the 3 properties, the action transforms the system into a state that satisfies these properties and eliminates any accesses present in the transformed state that would violate the property in the initial state, then the action is secure
- BST holds with these modified versions of the 3 properties

April 27, 2004

ECS 235

Slide #39

Reconsider System Z

- Initial state has subject s , object o , $C = \{\text{High}, \text{Low}\}$, and $K = \{\text{All}\}$. Take $f_c(s) = (\text{Low}, \{\text{All}\})$, $f_o(o) = (\text{High}, \{\text{All}\})$, $m[s,o] = \{\underline{w}\}$, and $b = \{(s, o, \underline{w})\}$.
- s requests \underline{r} access to o
- Now $f_o'(o) = (\text{Low}, \{\text{All}\})$, $(s, o, \underline{r}) \in b'$, and $m[s,o] = \{\underline{r}, \underline{w}\}$

April 27, 2004

ECS 235

Slide #40

Non-Secure System Z

- As $(s, o, r) \in b' - b$ and $f_o(o) \text{ dom } f_c(s)$, access added that was illegal in previous state
 - Under the new version of the Basic Security Theorem, System Z is not secure
 - Under the old version of the Basic Security Theorem, as $f_c'(s) = f_o'(o)$, System Z is secure

April 27, 2004

ECS 235

Slide #41

Response: What Is Modeling?

- Two types of models
 1. Abstract physical phenomenon to fundamental properties
 2. Begin with axioms and construct a structure to examine the effects of those axioms
- Bell-LaPadula Model developed as a model in the first sense
 - McLean assumes it was developed as a model in the second sense

April 27, 2004

ECS 235

Slide #42

Reconciling System Z

- Different definitions of security create different results
 - Under one (original definition in Bell-LaPadula Model), System Z is secure
 - Under other (McLean's definition), System Z is not secure

April 27, 2004

ECS 235

Slide #43

Key Points

- Confidentiality models restrict flow of information
- Bell-LaPadula models multilevel security
 - Cornerstone of much work in computer security
- Controversy over meaning of security
 - Different definitions produce different results

April 27, 2004

ECS 235

Slide #44

Overview of Integrity

- Requirements
 - Very different than confidentiality policies
- Biba's models
 - Low-Water-Mark policy
 - Ring policy
 - Strict Integrity policy
- Lipner's model
 - Combines Bell-LaPadula, Biba
- Clark-Wilson model

April 27, 2004

ECS 235

Slide #45

Requirements of Policies

1. Users will not write their own programs, but will use existing production programs and databases.
2. Programmers will develop and test programs on a nonproduction system; if they need access to actual data, they will be given production data via a special process, but will use it on their development system.
3. A special process must be followed to install a program from the development system onto the production system.
4. The special process in requirement 3 must be controlled and audited.
5. The managers and auditors must have access to both the system state and the system logs that are generated.

April 27, 2004

ECS 235

Slide #46
