

# Clinical Information Systems Security Policy

---

- Intended for medical records
  - Conflict of interest not critical problem
  - Patient confidentiality, authentication of records and annotators, and integrity are
- Entities:
  - Patient: subject of medical records (or agent)
  - Personal health information: data about patient's health or treatment enabling identification of patient
  - Clinician: health-care professional with access to personal health information while doing job

May 6, 2004

ECS 235

Slide #1

## Assumptions and Principles

---

- Assumes health information involves 1 person at a time
  - Not always true; OB/GYN involves father as well as mother
- Principles derived from medical ethics of various societies, and from practicing clinicians

May 6, 2004

ECS 235

Slide #2

## Access

---

- Principle 1: Each medical record has an access control list naming the individuals or groups who may read and append information to the record. The system must restrict access to those identified on the access control list.
  - Idea is that clinicians need access, but no-one else. Auditors get access to copies, so they cannot alter records

May 6, 2004

ECS 235

Slide #3

## Access

---

- Principle 2: One of the clinicians on the access control list must have the right to add other clinicians to the access control list.
  - Called the *responsible clinician*

May 6, 2004

ECS 235

Slide #4

## Access

---

- Principle 3: The responsible clinician must notify the patient of the names on the access control list whenever the patient's medical record is opened. Except for situations given in statutes, or in cases of emergency, the responsible clinician must obtain the patient's consent.
  - Patient must consent to all treatment, and must know of violations of security

May 6, 2004

ECS 235

Slide #5

## Access

---

- Principle 4: The name of the clinician, the date, and the time of the access of a medical record must be recorded. Similar information must be kept for deletions.
  - This is for auditing. Don't delete information; update it (last part is for deletion of records after death, for example, or deletion of information when required by statute). Record information about all accesses.

May 6, 2004

ECS 235

Slide #6

## Creation

---

- Principle: A clinician may open a record, with the clinician and the patient on the access control list. If the record is opened as a result of a referral, the referring clinician may also be on the access control list.
  - Creating clinician needs access, and patient should get it. If created from a referral, referring clinician needs access to get results of referral.

May 6, 2004

ECS 235

Slide #7

## Deletion

---

- Principle: Clinical information cannot be deleted from a medical record until the appropriate time has passed.
  - This varies with circumstances.

May 6, 2004

ECS 235

Slide #8

# Confinement

---

- Principle: Information from one medical record may be appended to a different medical record if and only if the access control list of the second record is a subset of the access control list of the first.
  - This keeps information from leaking to unauthorized users. All users have to be on the access control list.

May 6, 2004

ECS 235

Slide #9

# Aggregation

---

- Principle: Measures for preventing the aggregation of patient data must be effective. In particular, a patient must be notified if anyone is to be added to the access control list for the patient's record and if that person has access to a large number of medical records.
  - Fear here is that a corrupt investigator may obtain access to a large number of records, correlate them, and discover private information about individuals which can then be used for nefarious purposes (such as blackmail)

May 6, 2004

ECS 235

Slide #10

## Enforcement

---

- Principle: Any computer system that handles medical records must have a subsystem that enforces the preceding principles. The effectiveness of this enforcement must be subject to evaluation by independent auditors.
  - This policy has to be enforced, and the enforcement mechanisms must be auditable (and audited)

May 6, 2004

ECS 235

Slide #11

## Compare to Bell-LaPadula

---

- Confinement Principle imposes lattice structure on entities in model
  - Similar to Bell-LaPadula
- CISS focuses on objects being accessed; B-LP on the subjects accessing the objects
  - May matter when looking for insiders in the medical environment

May 6, 2004

ECS 235

Slide #12

## Compare to Clark-Wilson

---

- CDIs are medical records
- TPs are functions updating records, access control lists
- IVPs certify:
  - A person identified as a clinician is a clinician;
  - A clinician validates, or has validated, information in the medical record;
  - When someone is to be notified of an event, such notification occurs; and
  - When someone must give consent, the operation cannot proceed until the consent is obtained
- Auditing (CR4) requirement: make all records append-only, notify patient when access control list changed

May 6, 2004

ECS 235

Slide #13

## ORCON

---

- Problem: organization creating document wants to control its dissemination
  - Example: Secretary of Defense writes a memo for distribution to her immediate subordinates, and she must give permission for it to be disseminated further. This is “originator controlled” (here, the “originator” is a person).

May 6, 2004

ECS 235

Slide #14

# Requirements

---

- Subject  $s \in S$  marks object  $o \in O$  as ORCON on behalf of organization  $X$ .  $X$  allows  $o$  to be disclosed to subjects acting on behalf of organization  $Y$  with the following restrictions:
  1.  $o$  cannot be released to subjects acting on behalf of other organizations without  $X$ 's permission; and
  2. Any copies of  $o$  must have the same restrictions placed on it.

May 6, 2004

ECS 235

Slide #15

# DAC Fails

---

- Owner can set any desired permissions
  - This makes 2 unenforceable

May 6, 2004

ECS 235

Slide #16

# MAC Fails

---

- First problem: category explosion
  - Category  $C$  contains  $o, X, Y$ , and nothing else. If a subject  $y \in Y$  wants to read  $o, x \in X$  makes a copy  $o'$ . Note  $o'$  has category  $C$ . If  $y$  wants to give  $z \in Z$  a copy,  $z$  must be in  $Y$ —by definition, it's not. If  $x$  wants to let  $w \in W$  see the document, need a new category  $C'$  containing  $o, X, W$ .
- Second problem: abstraction
  - MAC classification, categories centrally controlled, and access controlled by a centralized policy
  - ORCON controlled locally

May 6, 2004

ECS 235

Slide #17

# Combine Them

---

- The owner of an object cannot change the access controls of the object.
- When an object is copied, the access control restrictions of that source are copied and bound to the target of the copy.
  - These are MAC (owner can't control them)
- The creator (originator) can alter the access control restrictions on a per-subject and per-object basis.
  - This is DAC (owner can control it)

May 6, 2004

ECS 235

Slide #18

# RBAC

---

- Access depends on function, not identity
  - Example: Allison is bookkeeper for Math Dept. She has access to financial records. If she leaves and Betty is hired as the new bookkeeper, Betty now has access to those records. The role of “bookkeeper” dictates access, not the identity of the individual.

May 6, 2004

ECS 235

Slide #19

# Definitions

---

- Role  $r$ : collection of job functions
  - $trans(r)$ : set of authorized transactions for  $r$
- Active role of subject  $s$ : role  $s$  is currently in
  - $actr(s)$
- Authorized roles of a subject  $s$ : set of roles  $s$  is authorized to assume
  - $authr(s)$
- $canexec(s, t)$  iff subject  $s$  can execute transaction  $t$  at current time

May 6, 2004

ECS 235

Slide #20

# Axioms

---

- Let  $S$  be the set of subjects and  $T$  the set of transactions.
- The *rule of role assignment* is  $(\forall s \in S)(\forall t \in T)[canexec(s, t) \rightarrow actr(s) \neq \emptyset]$ .
  - If  $s$  can execute a transaction, it has a role
  - This ties transactions to roles
- The *rule of role authorization* is  $(\forall s \in S)[actr(s) \subseteq authr(s)]$ .
  - Subject must be authorized to assume an active role (otherwise, any subject could assume any role)

May 6, 2004

ECS 235

Slide #21

# Axiom

---

- The rule of transaction authorization is  $(\forall s \in S)(\forall t \in T)$   
 $[canexec(s, t) \rightarrow t \in trans(actr(s))]$ .
  - If a subject  $s$  can execute a transaction, then the transaction is an authorized one for the role  $s$  has assumed

May 6, 2004

ECS 235

Slide #22

## Containment of Roles

---

- Trainer can do all transactions that trainee can do (and then some). This means role  $r$  contains role  $r'$  ( $r > r'$ ). So:

$$(\forall s \in S) [ r' \in \text{authr}(s) \wedge r > r' \rightarrow r \in \text{authr}(s) ]$$

May 6, 2004

ECS 235

Slide #23

## Separation of Duty

---

- Let  $r$  be a role, and let  $s$  be a subject such that  $r \in \text{auth}(s)$ . Then the predicate  $\text{meauth}(r)$  (for mutually exclusive authorizations) is the set of roles that  $s$  cannot assume because of the separation of duty requirement.
- Separation of duty:

$$(\forall r_1, r_2 \in R) [ r_2 \in \text{meauth}(r_1) \rightarrow \\ [ (\forall s \in S) [ r_1 \in \text{authr}(s) \rightarrow r_2 \notin \text{authr}(s) ] ] ]$$

May 6, 2004

ECS 235

Slide #24

## Key Points

---

- Hybrid policies deal with both confidentiality and integrity
  - Different combinations of these
- ORCON model neither MAC nor DAC
  - Actually, a combination
- RBAC model controls access based on functionality

May 6, 2004

ECS 235

Slide #25

## Overview

---

- Classical Cryptography
  - Caesar cipher
  - Vigènere cipher
  - DES
- Public Key Cryptography
  - Diffie-Hellman
  - RSA
- Cryptographic Checksums
  - HMAC

May 6, 2004

ECS 235

Slide #26

# Cryptosystem

---

- Quintuple  $(\mathcal{E}, \mathcal{D}, \mathcal{M}, \mathcal{K}, C)$ 
  - $\mathcal{M}$  set of plaintexts
  - $\mathcal{K}$  set of keys
  - $C$  set of ciphertexts
  - $\mathcal{E}$  set of encryption functions  $e: \mathcal{M} \times \mathcal{K} \rightarrow C$
  - $\mathcal{D}$  set of decryption functions  $d: C \times \mathcal{K} \rightarrow \mathcal{M}$

May 6, 2004

ECS 235

Slide #27

# Example

---

- Example: Cæsar cipher
  - $\mathcal{M} = \{ \text{sequences of letters} \}$
  - $\mathcal{K} = \{ i \mid i \text{ is an integer and } 0 \leq i \leq 25 \}$
  - $\mathcal{E} = \{ E_k \mid k \in \mathcal{K} \text{ and for all letters } m, \quad E_k(m) = (m + k) \bmod 26 \}$
  - $\mathcal{D} = \{ D_k \mid k \in \mathcal{K} \text{ and for all letters } c, \quad D_k(c) = (26 + c - k) \bmod 26 \}$
  - $C = \mathcal{M}$

May 6, 2004

ECS 235

Slide #28

# Attacks

---

- Opponent whose goal is to break cryptosystem is the *adversary*
  - Assume adversary knows algorithm used, but not key
- Three types of attacks:
  - *ciphertext only*: adversary has only ciphertext; goal is to find plaintext, possibly key
  - *known plaintext*: adversary has ciphertext, corresponding plaintext; goal is to find key
  - *chosen plaintext*: adversary may supply plaintexts and obtain corresponding ciphertext; goal is to find key

May 6, 2004

ECS 235

Slide #29

# Basis for Attacks

---

- Mathematical attacks
  - Based on analysis of underlying mathematics
- Statistical attacks
  - Make assumptions about the distribution of letters, pairs of letters (digrams), triplets of letters (trigrams), *etc.* (called models of the language). Examine ciphertext, correlate properties with the assumptions.

May 6, 2004

ECS 235

Slide #30

# Classical Cryptography

---

- Sender, receiver share common key
  - Keys may be the same, or trivial to derive from one another
  - Sometimes called *symmetric cryptography*
- Two basic types
  - Transposition ciphers
  - Substitution ciphers
  - Combinations are called *product ciphers*

May 6, 2004

ECS 235

Slide #31

# Transposition Cipher

---

- Rearrange letters in plaintext to produce ciphertext
- Example (Rail-Fence Cipher)
  - Plaintext is HELLO WORLD
  - Rearrange as  
HLOOL  
ELWRD
  - Ciphertext is HLOOL ELWRD

May 6, 2004

ECS 235

Slide #32

# Attacking the Cipher

---

- Anagramming
  - If 1-gram frequencies match English frequencies, but other  $n$ -gram frequencies do not, probably transposition
  - Rearrange letters to form  $n$ -grams with highest frequencies

May 6, 2004

ECS 235

Slide #33

# Example

---

- Ciphertext: HLOOLELWRD
- Frequencies of 2-grams beginning with H
  - HE 0.0305
  - HO 0.0043
  - HL, HW, HR, HD  $< 0.0010$
- Frequencies of 2-grams ending in H
  - WH 0.0026
  - EH, LH, OH, RH, DH  $\leq 0.0002$
- Implies E follows H

May 6, 2004

ECS 235

Slide #34

## Example

---

- Arrange so the H and E are adjacent

HE

LL

OW

OR

LD

- Read off across, then down, to get original plaintext

May 6, 2004

ECS 235

Slide #35

## Substitution Ciphers

---

- Change characters in plaintext to produce ciphertext
- Example (Cæsar cipher)
  - Plaintext is HELLO WORLD
  - Change each letter to the third letter following it (X goes to A, Y to B, Z to C)
    - Key is 3, usually written as letter 'D'
  - Ciphertext is KHOOR ZRUOG

May 6, 2004

ECS 235

Slide #36

## Attacking the Cipher

---

- Exhaustive search
  - If the key space is small enough, try all possible keys until you find the right one
  - Cæsar cipher has 26 possible keys
- Statistical analysis
  - Compare to 1-gram model of English

May 6, 2004

ECS 235

Slide #37

## Statistical Attack

---

- Compute frequency of each letter in ciphertext:  
G 0.1   H 0.1   K 0.1   O 0.3  
R 0.2   U 0.1   Z 0.1
- Apply 1-gram model of English
  - Frequency of characters (1-grams) in English is on next slide

May 6, 2004

ECS 235

Slide #38

## Character Frequencies

a	0.080	h	0.060	n	0.070	t	0.090
b	0.015	i	0.065	o	0.080	u	0.030
c	0.030	j	0.005	p	0.020	v	0.010
d	0.040	k	0.005	q	0.002	w	0.015
e	0.130	l	0.035	r	0.065	x	0.005
f	0.020	m	0.030	s	0.060	y	0.020
g	0.015					z	0.002

May 6, 2004

ECS 235

Slide #39

## Statistical Analysis

- $f(c)$  frequency of character  $c$  in ciphertext
- $\varphi(i)$  correlation of frequency of letters in ciphertext with corresponding letters in English, assuming key is  $i$ 
  - $\varphi(i) = \sum_{0 \leq c \leq 25} f(c)p(c - i)$  so here,  
$$\varphi(i) = 0.1p(6 - i) + 0.1p(7 - i) + 0.1p(10 - i) + 0.3p(14 - i) + 0.2p(17 - i) + 0.1p(20 - i) + 0.1p(25 - i)$$
  - $p(x)$  is frequency of character  $x$  in English

May 6, 2004

ECS 235

Slide #40

## Correlation: $\varphi(i)$ for $0 \leq i \leq 25$

$i$	$\varphi(i)$	$i$	$\varphi(i)$	$i$	$\varphi(i)$	$i$	$\varphi(i)$
0	0.0482	7	0.0442	13	0.0520	19	0.0315
1	0.0364	8	0.0202	14	0.0535	20	0.0302
2	0.0410	9	0.0267	15	0.0226	21	0.0517
3	0.0575	10	0.0635	16	0.0322	22	0.0380
4	0.0252	11	0.0262	17	0.0392	23	0.0370
5	0.0190	12	0.0325	18	0.0299	24	0.0316
6	0.0660					25	0.0430

May 6, 2004

ECS 235

Slide #41

## The Result

- Most probable keys, based on  $\varphi$ :
  - $i = 6$ ,  $\varphi(i) = 0.0660$ 
    - plaintext EBIIIL TLOLA
  - $i = 10$ ,  $\varphi(i) = 0.0635$ 
    - plaintext AXEEH PHKEW
  - $i = 3$ ,  $\varphi(i) = 0.0575$ 
    - plaintext HELLO WORLD
  - $i = 14$ ,  $\varphi(i) = 0.0535$ 
    - plaintext WTAAD LDGAS
- Only English phrase is for  $i = 3$ 
  - That's the key (3 or 'D')

May 6, 2004

ECS 235

Slide #42

## Cæsar's Problem

---

- Key is too short
  - Can be found by exhaustive search
  - Stastical frequencies not concealed well
    - They look too much like regular English letters
- So make it longer
  - Multiple letters in key
  - Idea is to smooth the statistical frequencies to make cryptanalysis harder

May 6, 2004

ECS 235

Slide #43

## Vigènere Cipher

---

- Like Cæsar cipher, but use a phrase
- Example
  - Message THE BOY HAS THE BALL
  - Key VIG
  - Encipher using Cæsar cipher for each letter:  
key VIGVIGVIGVIGVIGV  
plain THEBOYHASTHEBALL  
cipher OPKWWECIYOPKWIRG

May 6, 2004

ECS 235

Slide #44

## Relevant Parts of Tableau

---

	<i>G</i>	<i>I</i>	<i>V</i>
<i>A</i>	<b>G</b>	<b>I</b>	<b>V</b>
<i>B</i>	<b>H</b>	<b>J</b>	<b>W</b>
<i>E</i>	<b>L</b>	<b>M</b>	<b>Z</b>
<i>H</i>	<b>N</b>	<b>P</b>	<b>C</b>
<i>L</i>	<b>R</b>	<b>T</b>	<b>G</b>
<i>O</i>	<b>U</b>	<b>W</b>	<b>J</b>
<i>S</i>	<b>Y</b>	<b>A</b>	<b>N</b>
<i>T</i>	<b>Z</b>	<b>B</b>	<b>O</b>
<i>Y</i>	<b>E</b>	<b>H</b>	<b>T</b>

- Tableau shown has relevant rows, columns only
- Example encipherments:
  - key V, letter T: follow V column down to T row (giving “O”)
  - Key I, letter H: follow I column down to H row (giving “P”)

May 6, 2004

ECS 235

Slide #45

## Useful Terms

---

- *period*: length of key
  - In earlier example, period is 3
- *tableau*: table used to encipher and decipher
  - Vigenere cipher has key letters on top, plaintext letters on the left
- *polyalphabetic*: the key has several different letters
  - Caesar cipher is monoalphabetic

May 6, 2004

ECS 235

Slide #46

## Attacking the Cipher

---

- Approach
  - Establish period; call it  $n$
  - Break message into  $n$  parts, each part being enciphered using the same key letter
  - Solve each part
    - You can leverage one part from another
- We will show each step

May 6, 2004

ECS 235

Slide #47

## The Target Cipher

---

- We want to break this cipher:  
ADQYS MIUSB OXKKT MIBHK IZOOO  
EQOOG IFBAG KAUMF VVTAA CIDTW  
MOCIO EQOOG BMBFV ZGGWP CIEKQ  
HSNEW VECNE DLAAV RWKXS VNSVP  
HCEUT QOIOF MEGJS WTPCH AJMOC  
HIUIX

May 6, 2004

ECS 235

Slide #48

## Establish Period

- *Kaskski: repetitions in the ciphertext occur when characters of the key appear over the same characters in the plaintext*
- Example:

```

key    VIGVIGVIGVIGVIGV
plain  THEBOYHASTHEBALL
cipher OPKWWECIYOPKWIRG
    
```

Note the key and plaintext line up over the repetitions (underlined). As distance between repetitions is 9, the period is a factor of 9 (that is, 1, 3, or 9)

May 6, 2004

ECS 235

Slide #49

## Repetitions in Example

<i>Letters</i>	<i>Start</i>	<i>End</i>	<i>Distance</i>	<i>Factors</i>
MI	5	15	10	2, 5
OO	22	27	5	5
OEQOOG	24	54	30	2, 3, 5
FV	39	63	24	2, 2, 2, 3
AA	43	87	44	2, 2, 11
MOC	50	122	72	2, 2, 2, 3, 3
QO	56	105	49	7, 7
PC	69	117	48	2, 2, 2, 2, 3
NE	77	83	6	2, 3
SV	94	97	3	3
CH	118	124	6	2, 3

May 6, 2004

ECS 235

Slide #50

## Estimate of Period

---

- OEQOOG is probably not a coincidence
  - It's too long for that
  - Period may be 1, 2, 3, 5, 6, 10, 15, or 30
- Most others (7/10) have 2 in their factors
- Almost as many (6/10) have 3 in their factors
- Begin with period of  $2 \times 3 = 6$

May 6, 2004

ECS 235

Slide #51

## Check on Period

---

- Index of coincidence is probability that two randomly chosen letters from ciphertext will be the same
- Tabulated for different periods:

1	0.066	3	0.047	5	0.044
2	0.052	4	0.045	10	0.041
Large	0.038				

May 6, 2004

ECS 235

Slide #52

## Compute IC

---

- $IC = [n(n-1)]^{-1} \sum_{0 \leq i \leq 25} [F_i(F_i - 1)]$ 
  - where  $n$  is length of ciphertext and  $F_i$  the number of times character  $i$  occurs in ciphertext
- Here,  $IC = 0.043$ 
  - Indicates a key of slightly more than 5
  - A statistical measure, so it can be in error, but it agrees with the previous estimate (which was 6)

May 6, 2004

ECS 235

Slide #53

## Splitting Into Alphabets

---

alphabet 1: AIKHOIATTOBGEEERNEOSAI

alphabet 2: DUKKEFUAWEMGKWDWSUFWJU

alphabet 3: QSTIQBMAMQBWQVLKVTMTMI

alphabet 4: YBMZOAFCOOFPHEAXPQEPOX

alphabet 5: SOIOOGVICOVCSVASHOGCC

alphabet 6: MXBOGKVDIGZINNVVCIJHH

- ICs (#1, 0.069; #2, 0.078; #3, 0.078; #4, 0.056; #5, 0.124; #6, 0.043) indicate all alphabets have period 1, except #4 and #6; assume statistics off

May 6, 2004

ECS 235

Slide #54
