

## Outline for February 7, 2007

1. Greetings and Felicitations!
2. Integrity Matrix Model
  - a. Add in Biba
3. Clark-Wilson
  - a. Theme: military model does not provide enough controls for commercial fraud, etc. because it does not cover the right aspects of integrity
  - b. Data items: Constrained Data Items (CDIs) to which the model applies, Unconstrained Data Items (UDIs) to which no integrity checks are applied
  - c. Integrity Verification Procedures (IVPs) that verify conformance to the integrity spec when IVP is run
  - d. Transaction Procedures (TP) takes system from one well-formed state to another
4. Certification and enforcement rules:
  - a. C1. All IVPs must ensure that all CDIs are in a valid state when the IVP is run.
  - b. C2. All TPs must be certified to be valid, and each TP is associated with a set of CDIs it is authorized to manipulate.
  - c. E1. The system must maintain these lists and must ensure only those TPs manipulate those CDIs.
  - d. E2. The system must maintain a list of User IDs, TP, and CDIs that that TP can manipulate on behalf of that user, and must ensure only those executions are performed.
  - e. C3. The list of relations in E2 must be certified to meet the separation of duty requirement.
  - f. E3. The system must authenticate the identity of each user attempting to execute a TP.
  - g. C4. All TPs must be certified to write to an append-only CDI (the log) all information necessary to reconstruct the operation.
  - h. C5. Any TP taking a UDI as an input must be certified to perform only valid transformations, else no transformations, for any possible value of the UDI. The transformation should take the input from a UDI to a CDI, or the UDI is rejected (typically, for edits as the keyboard is a UDI).
  - i. E4. Only the agent permitted to certify entities may change the list of such entities associated with a TP. An agent that can certify an entity may not have any execute rights with respect to that entity.
5. Chinese Wall Policy
  - a. Arises as legal defense to insider trading on London stock exchange
  - b. Low-level entities are objects; all objects concerning the same corporation form a CD (company dataset); CDs whose corporations are in competition are grouped into COIs (Conflict of Interest classes)
  - c. Intuitive goal: keep one subject from reading different CDs in the same COI, or reading one CD and writing to another in same COI
  - d. Simple Security Property: Read access granted if the object (a) is in the same CD as an object already accessed by the subject, or (b) is in a CD in an entirely different COI. Assumes correct initialization
  - e. Theorems: (1) Once a subject has accessed an object, only other objects in that CD are available within that COI; (2) subject has access to at most 1 dataset in each COI class
  - f. Exceptions: sanitized information
  - g. \*-Property: Write access is permitted only if (a) read access is permitted by the simple security property; and (b) no object in a different CD in that COI can be read, unless it contains sanitized information
  - h. Key result: information can only flow within a CD or from sanitized information
  - i. Comparison to BLP: (1) ability to track history; (2) in CW, subjects choose which objects they can access but not in BLP; (3) CW requires both mandatory and discretionary parts, BLP is mandatory only
  - j. Comparison to Clark-Wilson: specialization of Clark-Wilson
