

Extra Credit 3

Due: June 5, 2025**Points:** 30

In homework4, you wrote two programs that read in and sorted words. The “word” was defined as any sequence of alphanumerics. But this did not take into account words split over two lines. For example,

```
hel-  
lo
```

is really the word “hello”. The two parts are separated by a hyphen, perhaps some space, a newline, and perhaps more space.

For this extra credit, take your program *wordsortl.c* and modify it so it will handle words that are split over 2 lines, as above.
